

WHAT IS CLAIMED IS:

1. A set of cards for a game having a plurality of types of characters displayed on each of the cards comprising:

a resistance member having a resistance value determined for each character,

wherein the resistance value of the resistance member is measured by causing the resistance member to come into contact with an external terminal.

2. A set of pieces for a game molded in a plurality of types of characters, each of the pieces comprising:

a resistance member having a resistance value determined for each character,

wherein the resistance value of the resistance member is measured by causing the resistance member to come into contact with external terminals.

3. A reading apparatus comprising:

a terminal for coming into contact with a resistance member having a resistance value determined for each of characters; and

correction means for correcting a parameter set to each of the characters,

wherein a type of a character is specified by measuring the resistance value of the resistance member through the terminal and wherein the parameter set to each character is corrected by the correction means based on a difference between the resistance

value determined to the character the type of which is specified
and an actually measured resistance value.
